

Veeam Endpoint Backup

What's New in 1.5?

Veeam® Endpoint Backup™ FREE 1.5 delivers all-new functionality to give you faster backup performance, greater visibility and control over backup job progress and schedules, and it even helps isolate your backups from malware attacks.

General

- **Built-in email notifications.** Receive backup job status reports by email without having to log onto each protected endpoint to view its protection status.
- **CryptoLocker protection.** Protect backup files residing on USB-based backup storage from potential CryptoLocker-type threats by automatically ejecting the backup storage immediately after a successful backup is completed.
- **Battery drain prevention.** To reduce power consumption and save battery life, job retries are now automatically suspended while your device is running off of the battery.

Scheduling

- **Daily backup enhancements.** Avoid useless backups during weekends by setting your backup job to run on weekdays only, or easily create a weekly backup schedule by scheduling backups on specific days of the week.
- **Protection from a missed daily backup.** The new scheduler option lets you configure backup jobs to perform a missed daily backup at the first opportunity by performing a backup once the computer is powered on — no more missed backups caused by an unexpected computer shut down!

Backup

- **File-level backup optimizations.** Enhancements to the file-level backup mode improve performance by 10% on average, increase stability and reduce VSS warnings.
- **File exclusion logic enhancement.** Added support for excluding a large number of files from backups. Previously, attempting to exclude too many files resulted in VSS warnings and failed file excludes.
- **Ability to skip bad blocks.** Based on popular demand, we've added an experimental capability to back up an already failing hard drive in a last attempt to save pieces of information that are still recoverable. To enable this functionality, create the SkipBadBlocks (DWORD) = 1 registry value under the HKLM\SOFTWARE\Veeam\Veeam Endpoint Backup key.

User Interface

- **Full backup to a custom location.** Perform an ad hoc full backup to any location from the user interface or via a command line. The created full backup will be standalone and will not be affected by retention policy.
- **Job progress monitor.** Monitor job progress even when the Control Panel is minimized by using the filling progress indicator on the Veeam Endpoint Backup taskbar icon.
- **Wi-Fi signal strength display.** Current Wi-Fi signal strength is now displayed on the Wi-Fi icon of the Recovery Media screen to inform you about possible connectivity issues that may result in slow or failed recovery.
- **Backup history chart switch.** Backup chart mode can now be switched between size and duration using the right-click menu, without having to go into the Control Panel settings.
- **Volume resize UI.** For your convenience, volume resize for large volumes can now be performed in GB, to prevent conversion mistakes due to large numbers.
